

Bayesian Classifier

Bayesian Classifier

- Statistical Classifier
- Predict Class Membership Probabilities
- Based on Bayes Theorem
- High Accuracy and Speed in large Databases
- Prior Probability: *Probability of X, $P(X)$*
- Posterior Probability: *Probability of X when consider some condition Y, $P(X|Y)$*
- A Simple Bayesian Classifier Naive Bayesian Classifier
 - Class Conditional Independence

MLE vs MAP

Maximum Likelihood Estimation

$$\begin{aligned}\theta_{MLE} &= \arg \max_{\theta} f(X_1, X_2, \dots, X_n | \theta) \\ &= \arg \max_{\theta} \sum_i \log f(X_i | \theta)\end{aligned}$$

Maximum A Priori

$$\begin{aligned}\theta_{MAP} &= \arg \max_{\theta} f(\theta | X_1, X_2, \dots, X_n) \\ &= \arg \max_{\theta} \left(\log g(\theta) + \sum_i \log f(X_i | \theta) \right)\end{aligned}$$

Conditional Independence

A and B are independent if,

$$P(A \cap B) = P(A) \times P(B)$$
$$\forall_{a,b} : P(A = a \cap B = b) = P(A = a) \times P(B = b)$$

A and B are conditionally independent given C if,

$$P(A, B | C) = P(A | C) \times P(B | C)$$
$$\forall_{a,b,c} : P(A = a \cap B = b | C = c) = P(A = a | C = c) \times P(B = b | C = c)$$

Bayes Theorem

$$P(H | X) = \frac{P(X | H)P(H)}{P(X)}$$

Likelihood

Prior Probability

Normalization Constant

Naive Bayes Classifier

- Attributes are conditionally independent
- Consider n -dimensional attribute vector, $X = (X_1, X_2, \dots, X_n)$
- Consider m classes, $C = (C_1, C_2, \dots, C_m)$
- Naive Bayes predicts that a tuple belongs to some class C_i

for given condition \mathbf{X} if and only if,

$$P(C_i | X) > P(C_j | X) \text{ for } 1 \leq j \leq m, j \neq i$$

- Goal: maximize $P(C_i | X)$

Naive Bayes Equations

Likelihood:
$$P(X | C_i) = \prod_{k=1}^n P(X_k | C_i)$$
$$= P(X_1 | C_i) \times P(X_2 | C_i) \times \dots \times P(X_n | C_i)$$

Categorical Attribute:

$$P(X_k | C_i) = \frac{|D_{X_k, C_i}|}{D_{C_i}}$$

Continuous-valued Attribute:
Gaussian Distribution

$$P(X_k | C_i) = g(X_k, \mu_{C_i}, \sigma_{C_i})$$
$$g(X, \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(X-\mu)^2}{2\sigma^2}}$$

Laplacian Correction

Add an extra count for each different value.

For attribute age,

- $\text{count}(\text{youth} \mid \text{no}) = 4$ (Actually 3)
- $\text{count}(\text{middleaged} \mid \text{no}) = 1$ (Actually 0)
- $\text{count}(\text{senior} \mid \text{no}) = 3$ (Actually 2)
- $\text{count}(\text{no}) = 8$ (Actually 5)

$$\begin{aligned} &= P(\text{age} = \text{middleaged} \mid \text{buyComputer} = \text{no}) \\ &= \frac{1}{8} \end{aligned}$$

| ID | age | income | student | creditRating | buyComputer |
|----|------------|--------|---------|--------------|-------------|
| 1 | youth | high | yes | fair | no |
| 2 | youth | low | no | excellent | no |
| 3 | middleaged | medium | no | fair | yes |
| 4 | middleaged | medium | no | fair | yes |
| 5 | senior | medium | yes | fair | yes |
| 6 | senior | low | no | excellent | no |
| 7 | middleaged | high | yes | excellent | yes |
| 8 | youth | medium | no | fair | no |
| 9 | youth | low | yes | fair | yes |
| 10 | senior | high | yes | fair | yes |
| 11 | youth | high | yes | excellent | yes |
| 12 | middleaged | medium | no | excellent | yes |
| 13 | middleaged | low | yes | fair | yes |
| 14 | senior | high | yes | excellent | no |

$X = (\text{age} = \text{middleaged}, \text{income} = \text{low}, \text{student} = \text{no}, \text{creditRating} = \text{fair})$

Thank You
